eyebrows

CARING FOR YOUR LIPS

- Three hours after procedure you will wash your lips with water and anti-bacterial soap. You will do this every three hours, or as often as possible for the first five days. This will help you heal and have the best possible outcome.
- Keep your lips hydrated with the provided ointment to help with the healing process.
- If by chance you break out in fever blisters it is recommended to speak to your Doctor as soon as possible and get a prescription for a medication such as Valtrex. Together with the medication you could purchase an ointment from your local CVS/Walgreens such as; Abreva or Lysine+ and apply it as instructed on the packaging.
- At times during the healing process it could appear as if the color has completely faded but please be patient, in a matter of three to four days after the color has faded it will surface again.

Enjoy!
